

Single-girder aluminum overhead crane

Data: 03.07.2026

www.melka.com.pl

Light crane system made of aluminum profiles providing very low rolling resistance and easy handling of loads by a single operator.

Aluminum single-girder cranes have been designed for workstations requiring frequent manual movement of loads. The use of special aluminum profiles significantly reduces the structure's own weight and the forces needed to operate the system.

The low weight and high corrosion resistance make this solution ideal for modern production and assembly plants.

Technical data

- Load capacity: up to 1000 kg
- Construction: aluminum
- Very low sliding resistance
- System expandability
- Compatibility with balancers and manipulators
- Custom dimension configuration
